YazamTech

ShuttleIT

Secure, automatic,
## Hazard-minimizing file transfer system

- Transfer files between securely separate networks without making any communication between the sending network and the receiving network.

- Automatic transfer, no user involved in the process.

- Hardware sets transfer direction: one way or two ways.

- Can be integrated with YazamTech SelectorIT file content filtering system.

ShuttleIT Systems

ShuttleIT V-mode - a single hardware unit that connects two separate networks, and allows an automatic transfer of files (bidirectional or unidirectional) while maintaining a complete disconnection between the networks.

ShuttleIT W-mode - a double hardware unit, an expansion of the V-mode configuration. This solution creates a sterile space for the operation of a content filtering system, protected against attacks from both sides of the separated networks.
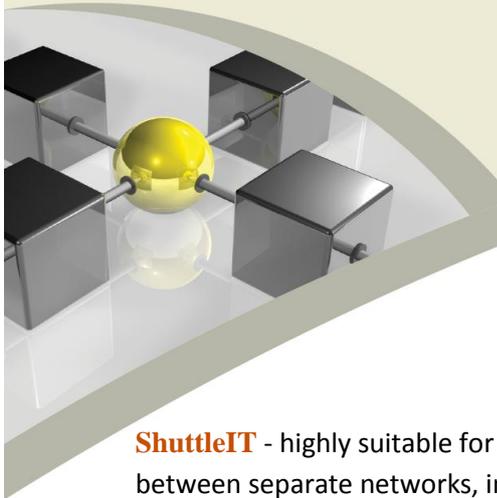

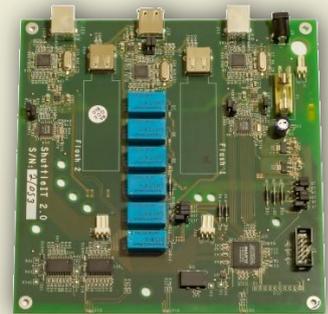

ShuttleIT - highly suitable for transferring files between separate networks, including automatic/background applications (with data that can be transformed to files).

- Two-way transfer of e-mail between two separate Email servers.

- Two-way transfer of faxes between a fax server and an Email server.

- One-way download of internet updates (e.g. antivirus updates) into a sensitive close network

- One-way upload of updates from a sensitive network to less sensitive areas like website updates, or sending text messages to a cellular network.

ShuttleIT - includes components that contribute to its security:

- Based on a specially designed hardware, providing a significantly higher level of security than an application installed on hardened hardware.

- Includes a programmed controller that manages the operation. Does not include an operating system that can be attacked.

- Uses highly-reliable electro-mechanical relays, ensuring a complete disconnection between the two separate ends networks.

- Hardware connects to the two networks with USB interface, and has no any communication interface like TCP, or an IP address.

- Serves both users and applications that have no need any user interface.

- Always listens to the source folders, and transfers new files immediately when arrived.

ShuttleIT - a technology to transfer files in a secure way. The system helps users need one-way or two-way transfers of files between separate networks, while minimizing risks.

ShuttleIT - family of security systems by YazamTech.
